## I. Introduction

Mesenchymal Stem Cells (MSC), also known as marrow stromal cells, are a self-renewing population of multipotent cells present in bone marrow and many other adult tissues.<sup>(1,2)</sup> MSC can be isolated from bone marrow by adherence to plastic,<sup>(1-4)</sup> and can differentiate into multiple lineage-specific cells that form bone, fat, cartilage, muscle, neuronal cells and tendon.<sup>(1-4)</sup> Due to their multilineage potential, they can be useful tools for a wide range of therapeutic and basic research, including transplantation studies and studies examining the repair of cardiac tissue, bone, cartilage, and tendons often using 3-D matrices.<sup>(1,4)</sup>

Trevigen's rat mesenchymal stem cells (RMSC) were isolated by adherence to plastic from adult male Fisher 344 rat bone marrow. The RMSC were passaged twice to ensure purity of the MSC population.<sup>(1,4)</sup> By passage 2, the cultures contain less than 1% contaminating hematopoietic cells, as confirmed by flow cytometry (Figure 1). They were positive for CD90 and CD29 and negative for CD11b and CD45 (hematopoietic cell markers). Rat and human mesenchymal stem cells have similar properties *in vitro*, but do not express the same cell surface markers.<sup>(1,3)</sup>

Trevigen's RMSC are provided as a frozen ampoule containing  $1 \times 10^6$  passage 3 cells. These cells can be maintained in an undifferentiated state when grown in Trevigen's Qualified RMSC Medium (cat# 5000-500-03) supplemented with RMSC Qualified FBS (cat# 5000-050-02) or induced to differentiate into adipogenic (cat# 5010-024-K) or osteogenic (cat# 5011-024-K) phenotype when growth media are supplemented with reagents contained in Trevigen's differentiation kits. Trevigen's RMSC can undergo 10 doublings without alteration in cell morphology or differentiation potential.

## II. Precautions and Limitations

1. For Research Use Only. Not for use in diagnostic procedures.
2. The physical, chemical, and toxicological properties of these products may not yet have been fully investigated; therefore, Trevigen recommends the use of gloves, lab coats, and eye protection while using these chemical reagents. Trevigen assumes no liability for damage resulting from handling or contact with these products.

## III. Materials Supplied

Component	Quantity	Storage	Catalog#
Rat Mesenchymal Stem Cells	1 Vial ( $1 \times 10^6$ Cells)	Liquid Nitrogen*	5000-001-01

\*Shipped on Dry Ice, immediately thaw for use, or for long term storage place in vapor phase of liquid nitrogen.

## IV. Materials/Equipment Required But Not Supplied

### Equipment

1. 1 - 20  $\mu$ l, 20 - 200  $\mu$ l, and 200 - 1000  $\mu$ l pipettors
2. Laminar flow hood or clean room
3. 37°C CO<sub>2</sub> incubator
4. 37°C Water Bath
5. Hemocytometer or other means to count cells
6. Inverted standard or phase microscope
7. Pipette aid

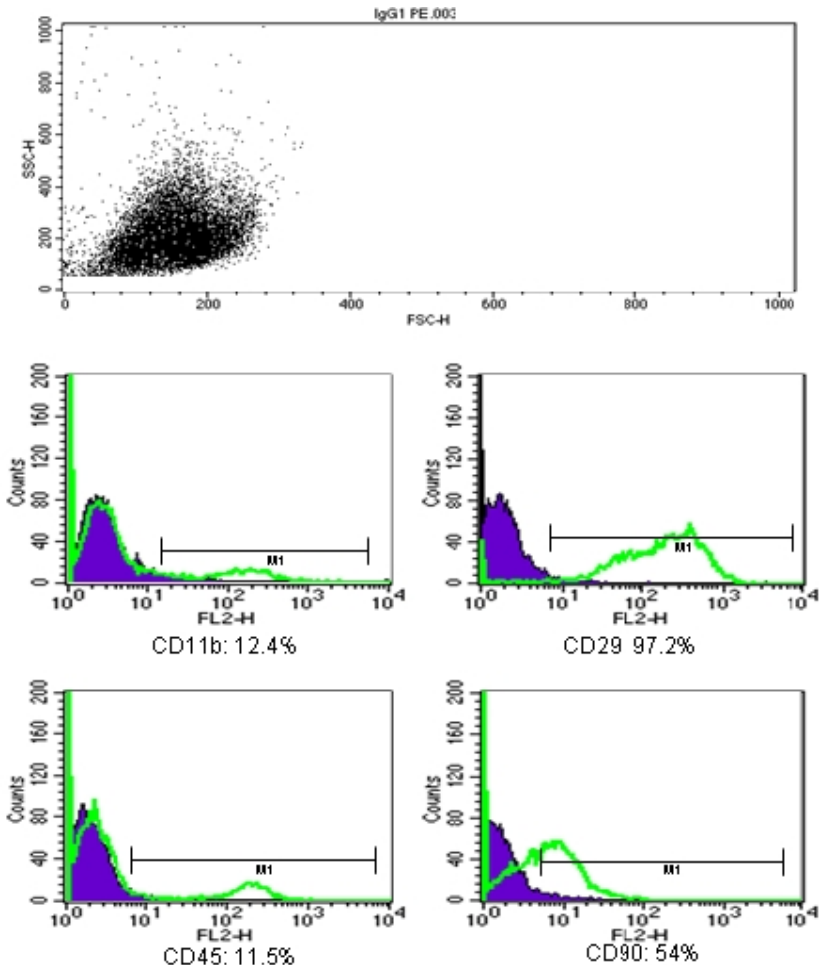

Figure 1: Flow Analysis of Rat Mesenchymal Stem Cells at Passage 2.

8. Liquid Nitrogen Storage
9. Low speed swinging bucket centrifuge and tubes for cell harvesting
10. Cell freezing container

### Reagents

1. Cell Culture Medium: Trevigen's Qualified RMSC Medium (cat# 5000-500-03) or equivalent
2. Cell Harvesting Reagent, trypsin, dispase, etc.
3. Trevigen's RMSC Qualified Fetal Bovine Serum (cat# 5000-050-02) or equivalent
4. Antibiotic Supplement for Media (optional)
5. Sterile PBS (Mg<sup>2+</sup>, Ca<sup>2+</sup> free) or HBSS
6. Trypan blue or equivalent viability stain
7. DMSO
8. 70% Ethanol

### Disposables

1. Cell culture flask, 25 cm<sup>2</sup>, 75 cm<sup>2</sup>, or 185 cm<sup>2</sup>
2. 15 ml tubes
3. 0.22 µm Filter Unit (optional)
4. 1 - 200 µl and 200 - 1000 µl pipette tips
5. 1, 5 and 10 ml serological pipettes
6. gloves

## V. Reagent Preparation

These procedures should be performed in a biological hood utilizing aseptic technique to prevent contamination.

### 1. Mesenchymal Complete Growth Medium

For 250 ml of Medium:

RMSC Medium (cat# 5000-500-03 or equivalent):	225 ml
FBS (cat# 5000-050-02 or equivalent):	25 ml

Optional: medium can be filter sterilized before use

Store medium at 4°C for one month

Ensure medium are at room temperature or 37°C prior to use

### 2. 2X Mesenchymal Freeze Medium

For 10 ml of Medium:

RMSC Medium (cat# 5000-500-03 or equivalent):	4 ml
FBS (cat# 5000-050-02 or equivalent):	4 ml
DMSO:	2 ml

Mix 1:1 with Growth Medium before use

## VI: Protocol

These procedures should be performed in a biological hood utilizing aseptic technique to prevent contamination.

### A. Thawing Mesenchymal Stem Cells:

1. Prepare Mesenchymal Complete Growth Medium (Section V.1):
2. Prewarm Complete Growth Medium to 37 °C by placing in 37°C H<sub>2</sub>O bath or in Tissue Culture Incubator.
3. Immediately before use, remove vial of cryopreserved rat mesenchymal stem cells (RMSC) from liquid nitrogen freezer.
4. Thaw frozen RMSC quickly in a 37°C H<sub>2</sub>O bath.
  - a. Ensure cells are completely thawed before proceeding.
  - b. Do not leave cells at 37°C for past thawing.
5. Spray down bottle with Complete Growth Medium with 70% EtOH before placing in Tissue Culture Hood.
6. Spray ampoule with 70% EtOH before placing in Tissue Culture Hood.
7. Aseptically, transfer the thawed cells to a 15 ml conical tube with a 5 ml pipette.
8. Wash ampoule with 1 ml of warm medium using a 5 ml pipette
9. Transfer the contents from step 8 to the 15 ml conical tube containing thawed cells dropwise, gently swirling to mix between drops.
10. Add 1 ml of warm medium to 15 ml conical tube containing cells, gently swirling to mix between drops. Total Volume should be 3 ml.
11. Centrifuge 15 ml conical tube at 200 X g for 3 minutes.
12. Remove supernatant gently to avoid disturbing cell pellet.
13. Resuspend cell pellet in 1 ml of fresh Mesenchymal Complete Growth medium.
14. Count cells on hemocytometer (per standard protocol).
15. Plate cells at a density of 5.4 x 10<sup>3</sup> cells/cm<sup>2</sup>. For a T-75 tissue flask add 4.05 x 10<sup>5</sup> cells in 12-15 ml Complete Growth Medium.
  - a. Recommend Corning® Tissue Culture Treated Plastic.
  - b. One vial of cells is sufficient to seed two T-75 or one T-185 flask.
16. Place Tissue Culture Flask/Dish in 5% CO<sub>2</sub> Tissue Culture Incubator at 37°C.
17. Change medium in flasks next day.

### B. Growing Mesenchymal Stem Cells:

1. Medium Change (the medium should be changed every 3-4 days).
  - a. Warm Complete Growth Medium to 37 °C by placing in 37°C H<sub>2</sub>O bath or in Tissue Culture Incubator.
  - b. Spray down bottle with Growth Medium with 70% EtOH before placing in Tissue Culture Hood.
  - c. Remove spent medium from T-75 flask containing Mesenchymal Stem Cells.
  - d. Add 12-15 ml of fresh Complete Growth Medium.
  - e. Discard used medium appropriately.

## 2. Passaging Rat Mesenchymal Stem Cells

*Note: When cells became 70-80% confluent, they are ready to be split. If allowed to over-grow, these cells will lay down a matrix and start to differentiate; as a result, the cells will peel off of the plastic which markedly reduces the ability to passage them.*

- a. Warm Complete Growth Medium and Trypsin solution to 37 °C by placing in 37 °C H<sub>2</sub>O bath or in Tissue Culture Incubator.
- b. Spray down bottles containing Growth Medium, or trypsin solution with 70% EtOH before placing in Tissue Culture Hood.
- c. Remove medium from T-75 flask containing Mesenchymal Stem Cells.
- d. Gently wash flask with 5-10 ml of sterile 1X PBS (Ca<sup>2+</sup> and Mg<sup>2+</sup> free)
- e. Remove PBS.
- f. Add 3 ml of Trypsin to each flask place at 37°C for 3-5 minutes (until cells are no longer attached to plate, should take less than 5 minutes) in Tissue Culture Incubator.
- g. Add 5 ml of Complete Growth Medium to flask.
- h. Transfer cells to 15 ml conical tube.
- i. Centrifuge 15 ml conical tube at 200 X g for 3 minutes.
- j. Remove supernatant gently to avoid disturbing cell pellet.
- k. Resuspend cell pellet in 2 ml of fresh Complete Growth Medium.
- l. Count cells on hemocytometer (per standard protocol).

## 3. Plating

- a. Plate cells at a density of  $5.4 \times 10^3$  cells/cm<sup>2</sup>. For a T-75 tissue flask add  $4.05 \times 10^5$  cells in 12-15 ml Complete Growth Medium.

*Note: One flask of 70-80% confluent cells should be able to be split into 2-3 T-75 flasks.*

**Figure 2: 10X Bright Field Images of Rat Mesenchymal Stem Cells**

## C. Freezing Cells

- a. Warm Complete Growth Medium and trypsin solution to 37 °C by placing in 37 °C H<sub>2</sub>O bath or in Tissue Culture Incubator.
- b. Make 2X Mesenchymal Freeze Medium, (see Section V.2) adjust volume according to volume needed (*Will be mixed 1:1 with Growth Medium*).
- c. Spray down bottles containing Growth Medium, Trypsin, and the 2X Freeze Medium tube with 70% EtOH before placing in Tissue Culture Hood.
- d. Remove medium from T-75 flask containing Mesenchymal Stem Cells from incubator.
- e. Gently wash flask with 5-10 ml of sterile 1X PBS (Ca<sup>2+</sup> and Mg<sup>2+</sup> free)
- f. Remove PBS.
- g. Add 3 ml of Trypsin to each flask, and place at 37 °C in Tissue Culture Incubator for 2-3 minutes (until cells are no longer attached to the plate, which should take less than 5 minutes).
- h. Add 5 ml of Complete Growth Medium to flask.
- i. Transfer cells to the 15 ml conical tube.
- j. Centrifuge 15 ml conical tube at 200 X g for 3 minutes.
- k. Remove supernatant gently to avoid disturbing cell pellet.
  - i. Resuspend cell pellet in 2 ml of Complete Growth Medium.
  - ii. Count cells on hemocytometer (per standard protocol).
  - iii. Dilute cells to a desired concentration for freezing.

*Notes: We recommend a concentration of no less than  $1 \times 10^6$  cells/ml. This concentration is enough to seed one T-75 flask (remember, the cells will be diluted 1:1 with freeze medium, final concentration  $0.5 \times 10^6$  cells/ml).*

*One T-75 flask will provide enough cells for 1-3 vials of  $5 \times 10^5$  cells per vial.*

- m. Add equal volume of 2X Freeze Medium to the cells, mix gently.
- n. Aliquot 1 ml of cells into labeled cryovials.
- o. Place on ice for 15-30 minutes.
- p. Transfer to cell freezing container and place in -80°C freezer overnight.
- q. Transfer to liquid nitrogen freezer for long term storage.

*Note: Vapor phase is recommended to ensure viability.*

## VIII. Troubleshooting

PROBLEM	CAUSE	ACTION
Poor Cell Recovery from flask (for cell growth)	Cell seeding density too high	Passage cells at lower confluency
Poor Viability from initial freeze	Too rough in thawing of cells	Ensure medium is added slowly to reequilibrate the RMSC from freeze medium Ensure cells were removed from freeze medium immediately after vial has been thawed Ensure Vial of cells was thawed at 37°C Fresh medium was prewarmed to 37°C
Poor proliferation	Fetal Bovine Serum not optimized for support of RMSC growth  Media not optimized for support of RMSC growth  Tissue Culture Labware not ideal for RMSC  Frequency of Medium Change  CO <sub>2</sub> Incubator not humidified  No gas exchange is allowed by flask	Use Qualified RMSC FBS from Trevigen  Use Qualified RMSC Medium from Trevigen  Used Corning or Nunc Treated Labware  Ensure medium is changed every 3-4 days Ensure pH of medium fresh medium has not changed  Add sterile water to CO <sub>2</sub> incubator per manufactures instructions  Ensure cap is loosened to allow air gas or use vented flask
Cells were clumpy after passaging, limited recovery of single cells	Cells were allowed to become over confluent and lay down matrix	Extend time in trypsin Tirtrate cells to remove as many cells as possible from matrix Remove visual matrix aggregated from tube before spinning (will reduce cell recovery) Pass cell suspension through cell strainer (will reduce cell recovery)

PROBLEM	CAUSE	ACTION
Contamination of Cells	Contaminated Medium	To prevent contamination, filter medium through a 0.22 µm filter before use  <i>Never use contaminated medium once cloudy or after microorganisms are visible under the microscope</i>
	Improper aseptic technique	Spray down hands, reagents and hood with 70% ethanol before opening any flasks
	Hood is working improperly	Check to make sure blower is on and functioning  Ensure hood is currently certified  Wipe down hood with 70% ethanol
	Contaminated CO <sub>2</sub> Incubator	Ensure CO <sub>2</sub> incubator is free of microbial growth

## IX. Related Products Available From Trevigen

Contact Trevigen for details of our unique product line for studying DNA damage and repair. All of Trevigen's kits include highly qualified enzymes, substrates, buffers, full instructions for use, and a synopsis specific for your kit.

### Differentiation:

Catalog #	Description	Size
5000-001-K	Cultrex <sup>®</sup> Rat Mesenchymal Stem Cell Starter Kit	1 vial
5000-001-R	Cultrex <sup>®</sup> RMSC Replenisher Kit	1 kit
5010-024-K	Cultrex <sup>®</sup> RMSC Adipogenic Differentiation Kit	24 samples
5011-024-K	Cultrex <sup>®</sup> RMSC Osteogenic Differentiation Kit	24 samples

### 3D Culture Kits:

Catalog #	Description	Size
3445-096-K	Cultrex <sup>®</sup> 3D Culture BME Cell Proliferation Assay Kit	96 tests
